LangChain

OMAR AHMED

what is Langchain ?

LangChain is an open-source framework used to build applications powered by Large Language Models (LLMs). It helps developers connect AI models with tools, memory, databases, APIs, documents, and workflows so the model can perform complex tasks instead of only answering single prompts.

Three important reasons people use LangChain:

1. It makes it easy to connect LLMs with external tools like PDFs, databases, web search, calculators, and APIs.
2. It supports “chains” and “agents” meaning the AI can perform multiple reasoning steps automatically.
3. It provides memory and retrieval systems, which help AI applications remember conversations and search private data efficiently (RAG systems).

LangChain can work with models from both Google and OpenAI. It is widely used by developers building applications on top of APIs from these companies. However, LangChain itself is not owned by Google or OpenAI; it is a separate framework created by the company LangChain.
